This document is not a traditional review sheet as you have seen in the past for lecture exams. Instead it is more of a guide to help you focus your student for the upcoming laboratory practical examination.

1. The laboratory practical examination will be a timed exam, and your laboratory instructor will guide you on the intervals to be spent at each station.

2. In order to succeed on this examination, you need to know the aspects of lab and be able to recall those details RAPIDLY. If you are at a learning stage where you can (nearly) instantly name any part of the human body covered in this section you will be able to do well. If you hem-and-haw about parts of the body, you will have a difficult time on this examination.

3. You have the ability to get an “A” grade on this exam, but to do so, you need to have applied consistently strong effort in learning the parts of the human body.

* * * * *

If you are engaging in some last-minute study to bolster your performance on the lab exam, the best thing that you can do is to work with one (or a few) other(s) in the class and “speed quiz” each other about the various parts of the human body to be covered.
